Synthetic Power Purchase Agreement — Wildorado Wind

PPA-WILDORADO-GOOGLE-001

SYNTHETIC SAMPLE FOR DEMONSTRATION ONLY

This document was generated for the VoltSentinel proof of concept. It is not a real contract, settlement statement, market notice, invoice, legal document, or operational instruction.

1. Agreement Summary

This Synthetic Power Purchase Agreement is entered into between VoltSentinel Renewables Wind Holdings LLC as Seller and Google Energy LLC as Buyer.

Contract ID: PPA-WILDORADO-GOOGLE-001. Facility: Wildorado Wind (CW_WIND_WILDORADO). ISO Region: ERCOT_WEST. Settlement Point: WILDORADO_RN.

This Agreement is created solely for testing document parsing, retrieval-augmented generation, and revenue leakage workflow automation.

2. Facility and Delivery

Seller shall deliver energy generated by the WIND facility to the agreed Point of Delivery and shall maintain operational data sufficient to support settlement, metering, and curtailment verification.

The Facility shall provide interval telemetry, metered generation, expected available output, and operating status information at five-minute or finer granularity where available.

3. Contract Price

Buyer shall pay Seller for delivered Contract Energy at a fixed contract rate of $42.50 per MWh, subject to the terms and exclusions in this Agreement.

The contract price is used by the commercial settlement system as the authoritative rate for estimating compensable curtailment value. The language in this document supports explanation; it is not the computational source of truth.

4. Compensable Curtailment

A Compensable Curtailment means a reduction in Facility output caused by an ISO, RTO, transmission provider, or Buyer instruction for congestion management, transmission constraint management, or similar grid reliability reasons, provided that the reduction is not caused by Seller fault, planned outage, equipment failure, Force Majeure, or failure to follow dispatch.

For a Compensable Curtailment, the eligible MWh shall equal the positive difference between expected available MWh and actual delivered MWh during the affected interval, using SCADA, meter, ISO notice, and settlement evidence.

For this contract, congestion and transmission-constraint curtailments are compensable. Negative-price economic curtailments are not compensable unless separately approved in writing. Contract ID: PPA-WILDORADO-GOOGLE-001.

5. Non-Compensable Curtailment

A Non-Compensable Curtailment includes curtailment caused by Seller equipment outage, Seller failure to follow dispatch, insufficient permits, Force Majeure, emergency conditions, negative price economic dispatch, or any outage not caused by

Buyer, ISO, RTO, or transmission provider action.

Seller is not entitled to payment for Non-Compensable Curtailment unless Buyer later determines through dispute resolution that the event was misclassified.

6. Lost Production Evidence

Seller shall provide supporting documentation for any compensable curtailment claim, including: ISO notice or dispatch instruction, five-minute SCADA intervals, expected available output, actual delivered output, metering data, settlement statement details, and calculation support.

Expected available output shall be based on best available telemetry and resource conditions during the affected interval. Actual delivered output shall be measured at or adjusted to the Point of Delivery.

7. Billing, Dispute, and Approval

Claims for compensable curtailment shall be reviewed as part of the monthly settlement process. Either Party may dispute settlement values by providing a written explanation and supporting documentation.

No external dispute case, invoice adjustment, or CRM workflow may be submitted without human commercial approval. Automated systems may prepare evidence packages but may not approve claims independently.
